

## 13 Treatable Causes Of Memory Loss

Many older adults suffer memory loss, but never receive proper medical attention because of the belief that it is a normal part of the aging process. More than 70 medical conditions have symptoms that mimic Alzheimer's disease and may cause memory problems. Below are a few of the more common conditions that are considered treatable. Early diagnosis and treatment could improve memory.

---

**1. Poor Nutrition:** Body chemistry can become imbalanced from the “tea and toast” syndrome, eating meals lacking the full range of necessary nutrients.

**2. Dehydration:** Many people do not drink enough fluids, or they consume primarily caffeinated beverages, which flush fluids out of the body.

**3. Fluctuation in Blood Sugar:** People who develop diabetes late in life may go for years without realizing they should ask their physician to check their blood sugar.

**4. Thyroid Deficiency:** Possible thyroid deficiency can be checked by a physician and remedied with medication.

**5. Infection:** Urinary tract or bladder infections are the most common infection, but any infection can cause memory loss

**6. Medication Combinations:** Taking multiple pills every day can result in mix-ups or medication interactions.

**7. Medication Toxicity:** Occasionally, too much medication accumulates in the blood. For example, Digoxin (Lanoxin) is a heart medication, which can become toxic

## 13 Treatable Causes of Memory Loss (cont'd)

---

**8. Depression:** Some people lose interest in others and become confused when they get depressed. Antidepressant medication may help significantly.

**9. Sensory Losses:** Loss of hearing or sight may interfere with orientation to time and place.

**10. Lung Disease:** Decreased lung capacity may mean insufficient oxygen to the brain. Memory loss may completely resolve when the person receives oxygen treatments.

**11. Cancer:** Tumors in the brain, liver, or other organs can lead to memory loss. Prompt diagnosis may mean that the tumor can be removed or reduced through treatment.

**12. Sleep Apnea:** Impaired breathing while sleeping may mean insufficient oxygen to the brain. Memory loss may completely resolve when sleep apnea is properly treated.

**13. Toxic House:** Furnaces sometimes malfunction and leave carbon monoxide in the air, producing confusion and sleepiness. Fixing the furnace may restore alertness. Installing carbon monoxide detectors can alert to future leaks.
