13 Treatable Causes Of Memory Loss

Many older adults suffer memory loss, but never receive proper medical attention because of the belief that it is a normal part of the aging process. More than 70 medical conditions have symptoms that mimic Alzheimer’s disease and may cause memory problems. Below are a few of the more common conditions that are considered treatable. Early diagnosis and treatment could improve memory.

1. Poor Nutrition: Body chemistry can become imbalanced from the “tea and toast” syndrome, eating meals lacking the full range of necessary nutrients.

2. Dehydration: Many people do not drink enough fluids, or they consume primarily caffeinated beverages, which flush fluids out of the body.

3. Fluctuation in Blood Sugar: People who develop diabetes late in life may go for years without realizing they should ask their physician to check their blood sugar.

4. Thyroid Deficiency: Possible thyroid deficiency can be checked by a physician and remedied with medication.

5. Infection: Urinary tract or bladder infections are the most common infection, but any infection can cause memory loss.

6. Medication Combinations: Taking multiple pills every day can result in mix-ups or medication interactions.

7. Medication Toxicity: Occasionally, too much medication accumulates in the blood. For example, Digoxin (Lanoxin) is a heart medication, which can become toxic.

8. Depression: Some people lose interest in others and become confused when they get depressed. Antidepressant medication may help significantly.

9. Sensory Losses: Loss of hearing or sight may interfere with orientation to time and place.

10. Lung Disease: Decreased lung capacity may mean insufficient oxygen to the brain. Memory loss may completely resolve when the person receives oxygen treatments.

11. Cancer: Tumors in the brain, liver, or other organs can lead to memory loss. Prompt diagnosis may mean that the tumor can be removed or reduced through treatment.

12. Sleep Apnea: Impaired breathing while sleeping may mean insufficient oxygen to the brain. Memory loss may completely resolve when sleep apnea is properly treated.

13. Toxic House: Furnaces sometimes malfunction and leave carbon monoxide in the air, producing confusion and sleepiness. Fixing the furnace may restore alertness. Installing carbon monoxide detectors can alert to future leaks.
